Project Name	Visitor Management System
Maximum Marks	2 Marks

Customer Problem Statement:

Corporate office facilities often face significant challenges in managing guest and visitor registrations efficiently, especially during peak morning check-in hours. Employees are required to manually handle unexpected arrivals or use physical logbooks, leading to long front-desk queues, building reception delays, and reduced operational security. Traditional paper-based tracking methods involve slow data entry, manually cross-checking credentials, and high clerical effort.

In addition, the absence of a centralized digital registration workflow makes it difficult to verify accurate contact data, alert hosting employees instantly, and track operational states in real time. These limitations highlight the need for an automated, secure, and highly scalable tracking application that can simplify guest arrivals while improving enterprise compliance.

The proposed **Visitor Management System** leverages ServiceNow to digitize the entire pre-registration and check-in pipeline. The system enables employees to log expected visitors ahead of time, enforces phone number formatting validation dynamically, updates record status attributes smoothly, and triggers automatic group email alerts to security dispatch. This directly cuts down operational friction, minimizes front-desk bottleneck delays, and elevates the workplace security experience.

I'm	The corporate employee who needs to host an external client on an urgent business schedule, but struggles with the slow, chaotic lines at the building's front reception desk.
I'm trying to	Achieve a fast, pre-registered, and hassle-free check-in experience for my visitor without relying on manual sign-in forms or face-to-face phone delays.

But	Due to the lack of an integrated, automated pre-registration platform, front-desk security remains unaware of upcoming visits and cannot clear guests in efficiently.
Because	There isn't an enterprise cloud platform workflow implemented at our location to bridge employee calendars directly with front-desk reception logs.
Which makes me feel	Confident that by utilizing ServiceNow to host this application, the communication gap between hosts and security teams can be resolved instantly.
